

Karyotype: 46,XY,del(20)(qq)[]

Chromosome analysis has shown an abnormal karyotype with a deletion in the long arm of chromosome 20.

Deletion of chromosome 20q is a common but non-specific finding in myeloid disorders and is consistent with the diagnosis of MDS. In particular, according to IPS, deletion of 20q as the sole abnormality is associated with a good prognosis in MDS, but should be interpreted in the context of other biological and clinical prognostic factors.

Conclusion:
